RE: Project HBB-DC1601

Dear Jane Houlihan,

On June 6, 2016, Brooks Applied Labs (BAL) received eighty (80) cereal samples. The samples were logged-in for the analyses of total recoverable arsenic (As) and arsenic speciation defined as arsenite [As(III)], arsenate [As(V)], inorganic arsenic (InorgAs) as the sum of As(III) and As(V), monomethylarsonic acid (MMAs) and dimethylarsinic acid (DMAs) according to the quotation. All samples were received and stored according to BAL SOPs and EPA methodology.

The results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

As analysis – batches B161427, B161464 & B161701

All cereals were digested via modified EPA Method 3050B with a mix of concentrated nitric acid, hydrochloric acid, and hydrogen peroxide.

Trace metals were analyzed using inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

In batch B161427, several sample results had concentrations within 10x the concentration of the highest method blank. Any sample result that was above the MRL and less than 10x the concentration of the highest method blank was qualified **X**.

As Speciation analysis – batches B161467, B161539 & B161630

All cereals were digested via an in-house method and analyzed with ion chromatography – inductively coupled plasma – mass spectrometry (IC-ICP-MS).

It should be noted that the digestion method typically induces conversion of As(V) to As(III) in the samples and matrix spikes and induces conversion of As(III) to As(V) in the blank spikes. These results have been reported, however the InorgAs result [the sum of As(III) and As(V)] is the most accurate number. No qualifications were made for low recoveries of As(III) or As(V) in the blank spikes or matrix spikes.

The initial calibration verification (ICV) standard recovered low for MMAs in batch B161467. All MMA results were qualified **J** for potential low bias. It should be noted that all sample results were non-detectable and showed no peak at the MMAs retention time.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

When the matrix spike/matrix spike duplicate (MS/MSD) set was not spiked with a particular analyte [either As(III) or As(V)], the recoveries were not reported (**NR**). The recovery for InorgAs should be consulted in these instances.

The InorgAs native result for sample *BioKinetics – Buckwheat Sprouted Baby Cereal* (1624015-07) and its associated duplicate (DUP) result yielded a RPD above the acceptance limit (30%). The sample result and the associated DUP met the secondary criteria of being less than 5x the MRL and within 2x the MRL of each other. No qualifications were necessary.

The MSD performed on sample *Gerber – Oatmeal Cereal* (1624015-20) and the MS/MSD set performed on sample *NuturMe – Organic Baby Cereal, Quinoa and Banana – 3.7 oz* (1624015-30) had low recoveries for InorgAs. The bracketing continuing calibration verification (CCV) standards were within criteria, but on the lower end (84% and 78%, respectively). Due to this, no qualifications were necessary as they were in line with the analytical run.

The MSD performed on sample *Gerber – Rice Cereal - 5* (1624015-60) had a slightly high recovery for InorgAs. It met duplicate precision criteria with the MS, which was within acceptance criteria. Due to this, no qualifications were necessary.

The data for batch B161630 was corrected by the bracketing CCVs because there was a clear shift in instrument sensitivity that was consistent throughout the analysis of the samples.

The MMAs recovery for SRM2 in batch B161630 had a low recovery. The result and the true value met the secondary criteria of being less than 5x the MRL and within 2x the MRL of each other. No qualifications were necessary.

All data was reported without further qualification and all other associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report. Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Lydia Greaves
Project Manager
lydia@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

BAL	Brooks Applied Labs	MS	matrix spike
BLK	method blank	MSD	matrix spike duplicate
BS	laboratory fortified blank	ND	non-detect
CAL	calibration standard	NR	non-reportable
CCB	continuing calibration blank	N/C	not calculated
CCV	continuing calibration verification	PS	post preparation spike
COC	chain of custody record	REC	percent recovery
D	dissolved fraction	RPD	relative percent difference
DUP	duplicate	SCV	secondary calibration verification
IBL	instrument blank	SOP	standard operating procedure
ICV	initial calibration verification	SRM	standard reference material
MDL	method detection limit	T	total fraction
MRL	method reporting limit	TR	total recoverable fraction

Definition of Data Qualifiers

(Effective 9/23/09)

B	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Result is estimated.
J	Estimated value. A full explanation is presented in the narrative.
J-M	Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.
J-N	Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.
M	Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.
N	Spike recovery was not within acceptance criteria. Result is estimated.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.
